Business Performance Dashboard

Dashboard Walkthrough

A visual guide explaining how to navigate, read and use each page of the Power BI dashboard, with the purpose of every major visual and the business questions it answers.

Revenue	Profit	Orders	Profit Margin
\$254.58K	\$95.61K	17.44K	37.6%
Units Sold	Average Order Value	Dashboard Pages	Interactive Filters
43.5K	\$14.59	4	Yes

Recommended viewing sequence: Executive Overview → Product & Category Analysis → Customer & Sales Behavior → Store & Geographic Analysis.

Dashboard purpose: move from “How is the business performing?” to “What is driving performance?” and finally to “Where and when should management act?”

1. Dashboard Navigation at a Glance

The report is organized as a guided analytical journey. The left-side navigation remains consistent across pages, while slicers at the top of each page allow users to change the reporting context.

Page	Primary Purpose	Best Used For
Executive Overview	Financial and operating snapshot	Management review and headline performance
Product & Category Analysis	Product/category contribution	Assortment, pricing and profitability decisions
Customer & Sales Behavior	Customer type and transaction patterns	Retention, timing and payment analysis
Store & Geographic Analysis	Location and regional performance	Store benchmarking and geographic planning

1.1 Common Dashboard Controls

- **Month / Date:** narrows the reporting period and enables time-based analysis.
- **Region:** focuses the dashboard on a geographic region.
- **Store:** isolates individual store performance.
- **Category:** filters the report to a product category.
- **Customer Type:** compares New and Returning transaction behavior.

Interaction principle: slicer selections update the KPI cards and relevant visuals together, allowing users to move from portfolio-level performance to a specific business segment.

2. Page 1 — Executive Overview

Purpose: provide a management-level snapshot of sales, profitability, volume and performance drivers before deeper investigation.

Figure 1. Executive Overview dashboard.

2.1 How to Read This Page

- **KPI cards:** start with Total Revenue, Total Profit, Total Orders, Units Sold and Profit Margin.

- **Revenue Performance Over Time:** compare monthly revenue and profit movement to identify peaks, dips and divergence.
- **Revenue by Store:** identify the stores contributing most to top-line performance.
- **Revenue by Category:** understand which categories dominate total revenue.
- **Revenue vs Profit by Category:** identify categories that combine scale with profitability.
- **Top 5 Products by Revenue:** identify the strongest individual products.

2.2 Executive Questions Answered

- Is the business generating healthy revenue and profit?
- Which months require further investigation?
- Which stores and categories are driving the business?
- Which products should receive attention from commercial teams?

Default-context snapshot: Revenue 254.58K • Profit 95.61K • Orders 17.44K • Units 43.5K • Margin 37.6%.

3. Page 2 — Product & Category Analysis

Purpose: move from overall business performance to the products and categories responsible for revenue, profit and volume.

Figure 2. Product & Category Analysis dashboard.

3.1 Visual Walkthrough

- **Top 5 Product by Revenue:** ranks the highest-value products and highlights the products that drive sales.
- **Top 5 Products by Profit:** separates sales leadership from profitability leadership.
- **Category Revenue Mix:** shows how concentrated the portfolio is across categories.
- **Category Performance:** compares revenue and profit side by side across categories.
- **Product Performance Summary:** provides category-level revenue, profit, units, average selling price and margin.

3.2 How to Use the Page

- Select a category to isolate its products and KPIs.
- Select a store to compare local product/category performance.
- Use Customer Type to test whether product mix changes between New and Returning transactions.
- Compare revenue rankings with profit rankings rather than assuming the highest-selling product is the most profitable.

Portfolio insight: Coffee contributes approximately 51.7% of total revenue (131.62K), making it the most important category in the supplied dataset.

4. Page 3 — Customer & Sales Behavior

Purpose: understand who is generating revenue, when transactions occur and which payment methods contribute to performance.

Figure 3. Customer & Sales Behavior dashboard.

4.1 Visual Walkthrough

- **Total / Returning / New Customers:** provides a quick view of the available customer-type mix.
- **Average Order per Customer:** provides a compact basket/frequency indicator within the available data structure.
- **Average Customer Spend:** summarizes average transaction value in the selected context.
- **Revenue by Customer Type:** compares revenue contribution between Returning and New segments.
- **Revenue by Day of Week:** identifies the strongest and weakest days.
- **Revenue by Time of Day:** highlights demand concentration across operating hours.
- **Profit by Payment Method:** shows contribution of payment channels.
- **Customer Retention Trend:** tracks monthly New vs Returning revenue percentages as a directional proxy.

Interpretation note: Returning customer-type transactions generate approximately 64.6% of total revenue. Because the source does not contain a persistent CustomerID, this should be interpreted as customer-type behavior rather than true unique-customer retention.

5. Page 4 — Store & Geographic Analysis

Purpose: identify where revenue is generated, compare stores and regions, and reveal geographic concentration.

Figure 4. Store & Geographic Analysis dashboard.

5.1 Visual Walkthrough

- **Total Store:** establishes the size of the store network in the current filter context.
- **Total Revenue / Orders / AOV:** connects geographic performance back to core business KPIs.
- **Top Performing Store:** immediately identifies the leading store.
- **Revenue by Region:** compares regional concentration.
- **Store Performance:** ranks the top five stores by revenue.
- **Revenue by Province:** provides map-based geographic context.
- **Revenue by City:** highlights the largest city contributors.
- **Store Count by Region:** helps distinguish performance from network size.
- **Revenue Heatmap by City:** makes geographic concentration easy to scan.

Portfolio insight: Toronto contributes approximately 53.1% of total revenue (135.13K), demonstrating strong geographic concentration in the supplied dataset.

6. Interactive Filtering — Recommended Workflow

Use filters as an analytical drill-down rather than changing several slicers randomly. The following workflow provides a repeatable investigation method.

Step	Action	What to Look For
1	Start with All filters.	Establish the overall baseline.
2	Select a Month/date range.	Check whether KPI trends change.
3	Select a Region or Store.	Compare local performance with the baseline.
4	Select a Category.	Identify product/category drivers.

Step	Action	What to Look For
5	Switch Customer Type.	Compare New vs Returning behavior.
6	Move across pages.	Trace the same context from financial to operational views.

Best practice: after each filter selection, read the KPI cards first, then the trend/ranking visuals, and finally the detailed tables or geographic views.

7. From Dashboard to Decision

Observation	Follow-up Analysis	Potential Business Action
Revenue falls in a month	Check store, category and time-of-day filters.	Investigate demand, availability or operational drivers.
One category dominates revenue	Compare its profit, units and product mix.	Protect availability and build complementary bundles.
Top store significantly outperforms	Compare its product mix, timing and customer type.	Benchmark successful practices across other stores.
Returning revenue is high	Compare monthly customer-type trend.	Strengthen repeat-visit and loyalty strategies.
Demand peaks on certain days/hours	Drill into store/category combinations.	Align staffing, inventory and promotions with demand.

8. Data Model Behind the Dashboard

The dashboard is supported by a star-schema-oriented model. SalesData acts as the central fact table, while DimDate, DimProduct, DimStore and DimLocation provide descriptive attributes for filtering and aggregation.

Figure 5. Power BI data model used by the dashboard.

8.1 Why the Model Matters

- Date attributes support month, weekday and time analysis.
- Product dimensions support category/product comparisons.
- Store and location dimensions support geographic analysis.
- Centralized fact data allows consistent KPI calculations.
- The dimensional approach makes the report easier to maintain and extend.

9. KPI Reading Guide

KPI	What It Tells You	Use With
Revenue	Top-line sales value.	Month, store, category, product
Profit	Absolute profit generated.	Category, store, payment method
Profit Margin	Profitability relative to revenue.	Category/product comparisons
Orders	Transaction volume.	Store, day, month, customer type
Units Sold	Physical sales volume.	Product/category
AOV	Average revenue per order.	Store, customer type, time

10. Dashboard Walkthrough Summary

The dashboard is designed to be read as a business story: **Executive Overview** establishes performance, **Product & Category Analysis** explains what is selling, **Customer & Sales Behavior** explains who and when, and **Store & Geographic Analysis** explains where.

- Start with KPIs before interpreting detailed visuals.
- Use slicers to isolate the business context you want to investigate.
- Compare revenue with profit rather than relying on sales volume alone.
- Use rankings to identify priorities and trends to identify timing.
- Treat customer-type metrics as directional until CustomerID is available.

Portfolio takeaway: this dashboard demonstrates an end-to-end Power BI workflow—from dimensional data modeling and KPI design to interactive reporting and business recommendations.

Usage note: This walkthrough documents the supplied portfolio dashboard and dataset and is not an official Tim Hortons corporate reporting manual.
